

Quick Start – Run with Docker

Prerequisites

- [Docker Desktop](#) installed and running
- [Node.js 18+](#) installed (for the MCP server)

Step 1 – Install MCP server dependencies (first time only)

```
cd minicrm-mcp
npm install
cd ..
```

Step 2 – Build and start all services

```
docker compose --profile mock --env-file docker.env up -d --build
```

This starts 6 containers:

Service	Port
Mock API (fake miniCRM data)	5090
ContactService	5081
ProjectService	5082
ToDoService	5083
InvoiceService	5084
API Gateway	5080

First run takes a few minutes — Docker downloads the .NET base images and builds the containers.

Step 3 – Verify all containers are running

```
docker compose --env-file docker.env ps
```

All 6 containers should show status `running` .

Step 4 – Test in Swagger

1. Open <http://localhost:5080/swagger>
2. Click the **Authorize** button (top right)
3. Enter the Gateway API key: `minicrm-gateway-2026-secure-key`
4. Click **Authorize**, then try `GET /api/contacts` — you should see 5 test contacts

Step 5 – Start the MCP server

```
cd minicrm-mcp && npm start
```

Step 6 – Open Claude Desktop

Open Claude Desktop and go to your miniCRM project.
Ask Claude: *"List my contacts"* — it should return the 5 seeded test contacts.

Stop everything

```
docker compose --env-file docker.env down
```

Useful commands

Command	Description
<code>docker compose --env-file docker.env ps</code>	Show running containers
<code>docker compose --env-file docker.env logs -f gateway</code>	Follow gateway logs
<code>docker compose --env-file docker.env down</code>	Stop and remove containers
<code>docker compose --env-file docker.env up -d</code>	Start again (no rebuild)

Switch to real miniCRM account

Edit `docker.env` :

```
MINICRM_SYSTEM_ID=YOUR_SYSTEM_ID
MINICRM_API_KEY=YOUR_API_KEY
# MINICRM_BASE_URL=http://mock-api:5090 ← comment out this line
GATEWAY_API_KEY=minicrm-gateway-2026-secure-key
```

Then start without the mock profile:

```
docker compose --env-file docker.env up -d --build
```
